# Your Lower Cost, Higher Volume Option

## The choice for long augmentation

RENÚ Voice is for long-term augmentation:

- A buffered hydrogel with synthetic, proven-biocompatible calcium hydroxylapatite (CaHA) particles 25 to 45 microns in size for consistent and easy injection.

## Higher volume, less waste

RENÚ Voice provides a greater volume of material than competitive products: 1.5 cc vs. 1.0 cc.<sup>1</sup> The greater volume:

- Helps eliminate waste and inconvenience.
- Reduces the added cost of opening additional syringes.

## Convenience and comfort at your fingertips

RENÚ Voice is provided in sterile, ready-to-use 1.5 cc syringes with ergonomic finger grips and a 2-year shelf life.

Inject RENÚ Voice percutaneously with a needle of your choice or with the RENÚ Double-Bevel, Trans-Oral Needle, supplied separately.<sup>2</sup>

## INJECTION OPTIONS:

Procedures completed by a healthcare professional

### Operating Room (OR) Trans-Oral Injection

- Visualization via direct laryngoscopy or micro-laryngoscopy

Operating Room Trans-Oral Injection

### Office Based Trans-Oral Injection

- Topical anesthesia
- Attach appropriate needle to RENÚ
- Prime needle with RENÚ (dead volume equals  $\approx 0.28\text{cc}$ )

Office Based Trans-Oral Calcium Hydroxylapatite (CaHA)

### Office Based Percutaneous Injections

Cricothyroid Cartilage approach

Thyroid Cartilage approach

Thyroid approach

### Important safety information

RENÚ<sup>®</sup> Voice is indicated for vocal fold medialization and vocal fold insufficiency that may be improved by injection of a soft tissue-bulking agent. RENÚ<sup>®</sup> Voice injection augments the size of the displaced or deformed vocal fold so that it may meet the opposing vocal fold at the midline for improved phonation. Vocal fold insufficiency associated with serious aspiration difficulty may be an urgent indication.

After injection of RENÚ<sup>®</sup> Voice, patients may experience transient throat soreness, bruising, swelling, or other local side effects. More rare side effects may include over-injection or under-injection that may require repeated intervention. As with any injection, there may be a risk of infection.
